Key points to develop LCA databases

Presentation to the AVNIR conference, Lille, 2012.11.06

Professor Bo Weidema

Chief Scientist

ecoinvent Centre

Key points

- Transparency at unit process level
- Flexibility for modelling choices
- Global scope
- Completeness
- Up-to-date
- A joint effort

Swiss Centre
For Life Cycle
Inventories

Transparency

Transparency

- Openness to scientific scrutiny and dialogue
- Documentation and quality of documentation
- Unit process level: validation, mass balances, peer review
- Accessibility: All ecoinvent unit process data and documentation freely accessible via the Internet
- Ecoinvent v3: Making modeling of markets and technology constraints an area for scientific dialogue

Swiss Centre
For Life Cycle
Inventories

Flexibility for modeling choices:

Consistent introduction of markets (consumption mixes) for all products

Swiss Centre
For Life Cycle
Inventories

ETH

PSI

EMPA

ART

Unlinked datasets with
product markets

Datasets linked,
based on geographical
location

- New datasets **automatically** linked to their suppliers and market

Simple: One unlinked system

Flexible: Many derived models

One simple, unlinked
system of datasets

Several models without
constraints, using
different allocation
properties

Several models with
different constraints,
using substitution

Global scope

Swiss Centre
For Life Cycle
Inventories

ETH

PSI

EMPA

ART

Completeness - economy-wide

Swiss Centre
For Life Cycle
Inventories

- Bottom-up databases typically give incomplete results. Leaving out 50% of the totals is not uncommon
- Economy-wide coverage: No overlaps, no double-counting, no cut-offs → Results are always complete
- Aggregation error must be expressed in the uncertainty
- Continuously more detailed through disaggregation → New datasets are immediately placed - and linked - into the right context, without requirements on the data provider to provide links

ETH

PSI

EMPA

ART

Completeness - physical, economical, social

- Combined physical and economical linking to reflect causalities: Example: waste treatment as a physical removal and an economic service
- Biophysical, social, and economic exchanges and impact categories
- Ensuring consistency across datasets
 - Temporarily including “unknown activities”?

Swiss Centre

Inventories

ETH

Up-to-date data

Swiss Centre
For Life Cycle
Inventories

- Continuous effort: A viable business model is required
- A joint effort is required. No single company or public authority can build this alone
- Reduce effort for individual data providers
- Increasing central addition and editing of data to ensure consistency
- **Let us join forces:** We do not need more than one global, transparent database
 - Like Wikipedia: Not a formal monopoly - but effectively being one, as a consequence of our authority
